

wherein each of the first and second pluralities of wirings is electrically isolated.

REMARKS

Entry of these amendments and the addition of new claims prior to initial examination is requested.

The new claims provided herewith delete the limitation of "a peripheral drive circuit portion". Hence, these claims define a display device without a drive circuit portion, formed on the same substrate as a pixel portion.

The specification defines that an active matrix type liquid crystal device, in which the peripheral drive circuit and the pixel portion are integrated on a panel (see, for example, page 3, line 17 through page 4, line 16). One purpose of this system is to eliminate problems in conventional devices, and therefore an object of this system is to provide a peripheral drive circuit integral type liquid crystal display which has excellent image quality and high reliability.

This system is applicable both to a display device with a drive circuit and without a drive circuit. For example, an amorphous silicon TFT type panel could also use this system.

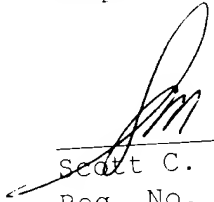

Applicant also calls attention to the enclosed documents listed on the attached form PTO-1449. Official consideration and citation is requested.

Please direct all future communications to the undersigned
